

# \*\*\*NOTICE\*\*\*

---

The model LE10 2-post lift has some new features that were not included in the E10 2-post lifts. Please review the improvements below to gain an understanding of the differences before installing the lift.

## **Improvements**

### **- Overhead Limit Switch**

The PVC tube mercury switch is no longer used. The new system uses 2 sheet metal housings that get bolted to the overhead beam using M6 hex flange nuts.

### **- Hose Routing**

Hose guides are no longer welded to columns. Hose clamps are now included and are bolted to columns using M8 pan head screws.

### **- Column Extensions**

The column extensions are now universally-designed so they can be bolted to either column. Also, all hose guide components at the top of the column extensions are bolted to extension using M6 bolts.

### **- Lock Release System**

The lock release cable is now supplied inside a nylon-lined sleeve and attaches to the lock pawls using small springs and a clevis pin as shown in the manual. Sleeved cable is now routed and secured to the column, column extension, and overhead using clamps and M5 pan head screws.

### **- Power Unit Bracket**

The bracket now includes key-hole slots to allow easier mounting of the power unit. The M8 bolts and nuts can be started on the power unit and will fit inside the larger openings of the key-holes and slide down into position on the mounting bracket.
